LUMBAR SPINE WITHOUT CONTRAST

INDICATION: Back pain.

COMPARISON: None.

TECHNIQUE: Sagittal and axial T1- and T2-weighted images and sagittal fat-suppressed images of the lumbar spine were obtained. Examination was performed at 3T.

FINDINGS:

Spinal column:

Curvature: Retrolisthesis is 3 mm at L5-S1.

Vertebral heights: Maintained.

Disc degeneration: Moderate at L5-S1 with dehydration, narrowing, prevertebral spondylosis, and reactive marrow change including mild to moderate edema.

Vertebral marrow: No worrisome lesions.

T12-L1: Unremarkable.

L1-L2: Unremarkable.

L2-L3: Unremarkable.

L3-L4: Unremarkable.

L4-L5: Unremarkable.

L5-S1: 4 mm broad disc bulge with unroofing inferiorly. Small broad central disc extrusion migrates 2 mm below superior endplate. No hypertrophic facet DJD. No central canal stenosis. Foraminal stenosis is mild bilaterally..

Spinal canal: The distal thoracic cord and cauda equina appear normal within the thecal sac. No mass.

Extraspinal:

Paraspinous muscles: Normal and symmetric without localized edema.

Interspinous ligaments: No focal edema to suggest sprain.

Other: The abdominal aorta is unremarkable. No retroperitoneal lymphadenopathy.

IMPRESSION:

1. Retrolisthesis is 3 mm at L4-5; disc degeneration is moderate at L5-S1; reactive marrow edema is mild to moderate at L5-S1.
2. L5-S1 small central disc extrusion; mild bilateral foraminal stenosis.
